Abstracts

Disposable EMG electrodes are single-use, self-adhesive sensors designed to detect and record the electrical activity produced by skeletal muscles during contraction and relaxation, serving as a critical diagnostic and monitoring tool in electromyography (EMG) procedures across clinical, research, and rehabilitation settings. These electrodes typically consist of a conductive gel or adhesive layer, a silver/silver chloride (Ag/AgCl) sensing element, and a lead wire connector, ensuring optimal signal quality, patient comfort, and hygiene by eliminating cross-contamination risks associated with reusable alternatives. Key product variations include pre-gelled electrodes for immediate use, solid gel formulations for longer recordings, and pediatric or specialty sizes, with performance characteristics such as low impedance, minimal noise interference, and consistent adhesion being essential for accurate neuromuscular assessment.

The global Disposable Emg Electrodes market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
