Report Overview

Intubation is a procedure to place a flexible plastic tube into the patient's trachea through mouth or nose to maintain an open airway and helps prevent suffocation or serve as a channel to administer an anesthetic, medication, and oxygen. The purpose of the Intubation varies with the location and type of tube inserted. The most widely used route for intubation is Orotracheal in which endotracheal tube is passed through the mouth into the trachea which is easier to perform and less painful.

During anesthesia, Intubation is efficient to facilitate ventilation of the lungs, as anesthesia drugs paralyze the muscles of the body including the diaphragm which makes breathing difficult. This allows the increasing need for Intubation during severe injuries which is expected to be a leading segment owing to the large patient base which is supposed to create enormous market revenue potential in Intubation market. Furthermore, accessibility of an extensive variety of methods to carry out the different procedures of Intubation and gaining popularity as a doable procedure in airway management has led the way to drive the growth of the Intubation Procedure market across the globe.
