Abstracts

A disposable hemodialyzer is a medical device designed for single use in hemodialysis, a procedure that filters waste products, excess fluids, and toxins from the blood in patients with kidney failure. It consists of a semipermeable membrane housed within a sterile, compact unit, which facilitates the exchange of substances between the blood and dialysate solution. As a critical component in renal replacement therapy, these devices are engineered to ensure biocompatibility, efficiency in solute clearance, and safety by minimizing risks of contamination, infection, or reuse-related complications. Their disposability aligns with modern healthcare standards emphasizing infection control, operational convenience, and consistent performance, making them integral to both in-center and home-based dialysis settings.
