Report Overview:

Membrane Chromatography Technology takes the membrane medium as the matrix, and couples the corresponding chemical groups to make a new type of chromatography medium. Membrane chromatography uses membranes with micro-sized pores with functional ligands on the inner surface of the pores throughout the membranes. High surface area and large pore size offers high dynamic binding capacities and can be easily incorporated into processes for removing impurities or purifying select molecules such as coagulation factors or viral vectors.

Membrane chromatography is a well-established technology in bioprocessing. It is routinely used in the capture of large particles such as viruses and viral vectors, as well as in polishing steps for the removal of DNA, HCPs and virus. One hallmark of membrane chromatography is high productivity, others are high throughput and cost saving.

Membrane chromatography has been shown to be an effective disposable virus purification technique. Single-use membrane adsorbers are ready-to-use devices that dramatically reduce hands-on time, eliminate packing failures, and obviate the need for cold room storage. Both risk and upfront investments are favorably impacted. At the same time they enhance bioburden control and productivity.

Overall, Disposable Membrane Chromatography Technology has the following advantages? High Throughput, Compact Footprint, High Capacity, Chromatography as Easy as Filtration, Flow-Through Aggregate Removal and others.

The Global Disposable Membrane Chromatography Technology Market Size was estimated at USD 339.69 million in 2023 and is projected to reach USD 608.37 million by 2029, exhibiting a CAGR of 10.20% during the forecast period.
