Abstracts

A disposable temperature recorder is a portable device used to monitor and record changes in ambient temperature. It is mainly used in cold chain transportation, pharmaceutical products, food safety, chemical raw materials and other scenarios with strict temperature requirements. The device is small in size and easy to use. It records the ambient temperature in real time through a built-in high-precision temperature sensor, and exports the data as a report in PDF or CSV format through a USB interface or NFC technology after use, without the need for additional software or hardware support. Disposable temperature recorders usually have preset parameters such as sampling intervals and alarm thresholds before leaving the factory. They can run automatically after startup and often have the function of alarming when the temperature exceeds the range (such as LED indicator lights). Since it is designed for single use, it does not need to be recycled or recalibrated, which simplifies the operation process and reduces the cost of use. The device is mostly waterproof and dustproof, supports wide temperature range recording (such as -30°C to 70°C), and ensures reliable monitoring of environmental parameters during transportation or storage.

The global Disposable Temperature Recorder market size was estimated at USD 187.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
