Abstracts

Disposable ureteroscopes are single-use, sterile medical devices designed for diagnostic and therapeutic procedures within the urinary tract, specifically for visualizing and accessing the ureter and kidney during urological interventions such as stone retrieval, stricture management, and tumor biopsy. Unlike reusable scopes, which require extensive and costly reprocessing between uses, disposable variants eliminate cross-contamination risks, reduce repair and maintenance expenses, and offer consistent optical and mechanical performance without degradation from repeated sterilization cycles. These instruments typically integrate advanced features such as high-definition imaging, flexible or semi-rigid designs, and working channels for accessory introduction, providing a practical and increasingly favored solution in modern urology practices aiming to enhance efficiency, lower operational complexity, and improve patient safety.

The global Disposable Ureteroscope market size was estimated at USD 52.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.25% during the forecast period.
