Abstracts

A disposable valve catheter is a single-use medical device designed for insertion into the body to access, drain, or deliver fluids to specific anatomical sites, typically the urinary tract or vascular system, and incorporates a one-way or anti-reflux valve mechanism to prevent backflow of fluids or air, thereby reducing the risk of contamination and infection. These catheters are commonly made from biocompatible materials such as silicone, latex, or polyurethane and are engineered for ease of use, patient safety, and sterility, with features often including hydrophilic coatings for smoother insertion, radiopaque markers for visibility under imaging, and connectors compatible with standard medical tubing. The inclusion of the valve distinguishes it from open-ended catheters, offering controlled fluid management and minimizing the need for external clamping, which is particularly valuable in settings requiring strict aseptic technique or long-term drainage management.

The global Disposable Valve Catheter market size was estimated at USD 345.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
