Abstracts

Dissecting microscopes, also known as stereomicroscopes or stereo microscopes, are specialized optical instruments designed to provide a three-dimensional, magnified view of relatively large, solid specimens that require manipulation or dissection during observation, featuring two separate optical paths with slightly different viewing angles to produce a stereoscopic image, typically offering lower magnification ranges (commonly 5x to 80x) compared to compound microscopes, with a large working distance between the objective lens and the specimen to accommodate tools, and are widely used across fields such as biology, electronics, geology, forensics, manufacturing, and education for tasks requiring detailed surface examination or precise manual intervention.

The global Dissecting Microscopes market size was estimated at USD 480.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
