### Report Overview:

Distillation is the process of separating the components or substances from a liquid mixture by using selective boiling and condensation. Distillation may result in essentially complete separation (nearly pure components), or it may be a partial separation that increases the concentration of selected components in the mixture. In either case, the process exploits differences in the volatility of the mixture's components. In industrial chemistry, distillation is a unit operation of practically universal importance, but it is a physical separation process, not a chemical reaction.

The Global Distillation Systems Market Size was estimated at USD 5687.62 million in 2023 and is projected to reach USD 6751.85 million by 2029, exhibiting a CAGR of 2.90% during the forecast period.
