Abstracts

Distillers' grain feed, commonly referred to as "distillers' dried grains with solubles (DDGS)," is a byproduct of the distillation process from various fermented grains, including those used in Baijiu production. The byproduct is rich in protein, fiber, and essential nutrients, making it an ideal feed ingredient for livestock, poultry, and aquaculture.

Sustainability and Waste Reduction:The global focus on reducing food and agricultural waste is contributing to the growing utilization of distillers' grains as animal feed. By recycling these byproducts, distilleries can reduce their environmental footprint and support circular economies.

Increased Livestock Production:As the global demand for meat and dairy products continues to rise, the need for cost-effective and high-quality animal feed is increasing. Distillers' grain feed is being used to meet this demand.

Quality Control:The nutritional value of distillers' grains can vary depending on the fermentation process, which may affect the consistency and quality of the feed.

Storage and Transport Issues:As a perishable product, distillers' grain feed can present storage and transport challenges, particularly in areas where refrigeration or specialized logistics are required.

Alternative Protein Sources:With increasing pressure on the global food system, the development of alternative protein sources like distillers' grains is expected to gain momentum as a solution to feed shortages.

The global Distillers' Grain Feed market size was estimated at USD 1086.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
