Report Overview:

Distributed acoustic sensing systems (DAS) are fiber optic based optoelectronic instruments which measure acoustic interactions along the length of a fiber optic sensing cable. The unique feature of a distributed acoustic sensing system is that it provides a continuous (or distributed) temperature profile along the length of the sensing cable and not at discrete sensing points.

DAS or Distributed Acoustic Sensors (DAS) are a revolutionary photonic sensing technology that convert standard communications fibre into a linear array of discrete vibration sensors. Activities such as people hot-tapping pipelines, leaks, perimeter intrusions, moving vehicles, industrial operations, failing mechanical components, and so many more all generate vibrations with distinct acoustic characteristics. DAS technology monitors these vibrations, and if supported by the right software accurately detects, classifies and reports on the vibration events – locating the position of each event to within a few metres.

The Global Distributed Acoustic Sensing Systems Market Size was estimated at USD 526.88 million in 2023 and is projected to reach USD 1012.42 million by 2029, exhibiting a CAGR of 11.50% during the forecast period.
