Abstracts

The Distributed Control System Simulator is a comprehensive platform that uses software modeling and simulation technology to fully reproduce the hardware platform, control logic, and process dynamics of an industrial distributed control system in a high-fidelity virtual environment. It not only accurately simulates the operating characteristics and fault modes of hardware components such as controllers, I/O modules, and network communications, but also seamlessly integrates process models to achieve dynamic simulation of the physical characteristics of the controlled object. The core value of this simulator lies in building a "digital twin" sandbox independent of the actual production environment, supporting offline testing and verification of control system configuration, optimization and analysis of control strategies, skills training for operators, and fault diagnosis drills for system maintenance personnel. By exposing and resolving configuration logic conflicts, network configuration errors, and insufficient control performance in advance, this system can significantly shorten the on-site commissioning cycle, reduce the risks of direct experimentation on production equipment, and effectively improve the quality and reliability of control system operation. It is a key tool for achieving intelligent manufacturing and safe operation in the process industry.

The global Distributed Control System Simulator market size was estimated at USD 91.56 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
