Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Distributed DTU competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Distributed DTU is a data acquisition and terminal control device based on a distributed architecture. It achieves parallel processing and redundant design by distributing data acquisition, processing and control tasks to multiple independent nodes (such as interval units and common units), thereby improving the scalability, efficiency and reliability of the system. Distributed DTU usually consists of several interval units and common units. The interval units are independently installed in each interval switch cabinet to complete the local measurement and control terminal function, while the common units are centrally installed and connected to each other through the bus to cooperate with each other to complete the function of DTU. This structure enables distributed DTU to quickly isolate faults to avoid affecting the operation of the entire distribution network, thereby reducing the losses of power supply and power users.

The global Distributed DTU market size was estimated at USD 702.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
