Report Overview

The principle of distributed fiber sensing system is to use fiber as sensing sensor and transmission signal medium at the same time, and adopt advanced odr technology and ofdr technology to detect the changes of temperature and strain along different positions of fiber, so as to realize truly distributed measurement. Distributed fiber optic sensor is a sensor that USES the unique distributed fiber optic detection technology to measure or monitor the spatial distribution and time-varying information along the fiber optic transmission path. By arranging the sensing fiber along the field, it can obtain the spatial distribution of the measured field and the change information with time at the same time, which is very attractive for many industrial applications.

The global Distributed Fiber Optic Sensing market size was estimated at USD 1024.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
