Abstracts

The distributed optical fiber temperature measurement host is the core equipment used in the distributed optical fiber temperature measurement system, responsible for receiving and processing the temperature signal transmitted through the optical fiber. Its working principle is based on optical fiber sensing technology. It propagates optical signals in the optical fiber and uses the scattering effect of optical signals (such as Raman scattering, Rayleigh scattering, etc.) to monitor the temperature changes along the optical fiber. The host demodulates these signals to obtain and analyze temperature data in real time. It is widely used in temperature monitoring and fault warning in the fields of electricity, petroleum, chemical industry, railways, etc. It has the characteristics of high precision, long distance, real-time monitoring, etc., and can work reliably in harsh environments.

The global Distributed Optical Fiber Temperature Measurement Host market size was estimated at USD 1239.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.70% during the forecast period.
