## Abstracts

Distributed vector search system is a search technology used to efficiently find similar data in massive data sets. By converting data (such as text, images, videos, user behavior, etc.) into high-dimensional vectors, the system can quickly calculate the similarity between data and achieve large-scale parallel processing under a distributed architecture. This system is widely used in personalized recommendations, semantic search, image recognition and other fields, solving the efficiency bottleneck of traditional search methods when processing unstructured data. The downstream applications of distributed vector search systems are primarily concentrated in industries that perform real-time similarity retrieval of massive amounts of unstructured data. These include AI large-scale model service providers, intelligent recommendation platforms, search engines, video and image content platforms, security and smart city monitoring, financial risk control, advertising platforms, intelligent customer service, cross-border e-commerce search, and industrial visual inspection. These users typically require high-concurrency, low-latency retrieval and inference on vector scales ranging from hundreds of millions to trillions. Due to the strong foundational role of vector retrieval in AI systems and its low substitutability, downstream customers are sensitive to performance and stability, exhibiting a high willingness to pay. The industry's average gross profit margin is generally around 63%. Distributed vector search systems represent a major advancement in the field of data processing and information retrieval. Through efficient vectorization and distributed computing, they overcome the limitations of traditional search methods in processing large-scale, high-dimensional data. This system not only improves the speed and accuracy of data retrieval, but also makes applications such as personalized recommendations, real-time search, and intelligent analysis possible. With the surge in data volume and the diversification of business needs, distributed vector search systems will become an important tool to promote intelligence and big data analysis, providing more efficient solutions for all walks of life.

The global Distributed Vector Search System market size was estimated at USD 3114.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.30% during the forecast period.
