Report Overview:

A Distribution Transformer Monitor (DTM) is a specialized hardware device that collects and measures information relative to electricity passing into and through a distribution transformer.

Standard positioning of DTM devices occurs at the transformer bushings, but sometimes they are attached directly onto the secondary electricity lines.

DTM devices commonly consist of highly accurate non-piercing or piercing sensors, onboard communications modules to transmit information, and a power supply provision.

The DTM device reports to a collection engine, and/or existing SCADA/MDM system where relevant transformer data is stored and presented to the user; analytics platforms are oftentimes employed to interpret the information being captured and reported by the DTM.

The Global Distribution Transformer Monitor Market Size was estimated at USD 859.55 million in 2023 and is projected to reach USD 1026.35 million by 2029, exhibiting a CAGR of 3.00% during the forecast period.
