Abstracts

Diversified protein degradation platforms are a type of biotechnology that aim to achieve selective regulation of specific proteins by regulating the degradation of intracellular proteins. These platforms mainly utilize the natural mechanism of protein degradation to guide the target protein into the protease system, thereby promoting its degradation. PROTACs (protein-targeting fusion molecules), PHOTACs (photosensitive PROTACs), LyTACs (lysosome-targeting fusion molecules), molecular glues (Molecular Glues), AUTACs (autophagosome-targeting fusion molecules), etc. are common protein degradation platforms. The protein degradation platform is expected to promote the development of precision medicine, achieving personalized treatment and reducing side effects by selectively regulating specific proteins. Overall, diversified protein degradation platforms have great potential in biomedical research and clinical treatment. Future development trends will focus on improving the controllability and specificity of the platform, as well as its wide application in more disease fields.

The global Diversified Protein Degradation Platform market size was estimated at USD 1535.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 17.80% during the forecast period.
