Abstracts

Divided Wall Column (DWC) Technology is a distillation technology that integrates the functions of multiple traditional distillation columns into a single column. It features a vertical partition wall inside the column, which divides the column into different zones such as a prefractionator and a main column. The feed mixture enters the prefractionator first and is roughly separated into different streams. Then, these streams enter the main column for further separation. This technology can separate mixtures of several components into three or more high - purity streams. By eliminating the remixing effect inherent in conventional distillation sequences and integrating multiple separation steps, it achieves significant energy savings, with energy consumption reductions of 20 % - 40 % compared to conventional methods. Meanwhile, it can also reduce capital costs by about 30 % and operating costs by 40 %.

The global Divided Wall Column (DWC) Technology market size was estimated at USD 283.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
