Report Overview

A diving air mixer is a device used to mix air and other gases for diving applications. It is typically used to mix compressed air and other gases to produce breathing gases suitable for divers. The working principle of a diving air mixer is to inhale compressed air and other gases, such as oxygen, nitrogen, and helium, and mix them together to produce respiratory gas with the required composition. The gas mixture is usually controlled by a series of valves and regulators, and divers can adjust the gas mixture according to their own needs.
