Abstracts

The Pockels cells consists of an electro-optical crystal (with electrodes placed on it) in which light propagates. The phase delay in the crystal (see Pockels effect) can be modulated by applying a variable voltage. Therefore, the Pockels cell can be regarded as a voltage-controlled wave plate. The Pockels cell is the basic element of an electro-optic modulator and can be used for Q-switched lasers. Pockels cells are commonly used for electro-optical Q-switching in the range of 200nm-2000nm. They can apply voltage to the crystal to change the polarization state of light and have the characteristics of low absorption and small size. The DKDP Pockels cell is a laser modulation component based on the electro-optic effect of the DKDP crystal. With the advancement of production equipment technology and the rapid development of optical communications and other fields, DKDP Pockels cells as upstream devices will also develop rapidly with this wave. At the same time, with the expansion of the downstream market's application scenarios for DKDP Pockels cells, the requirements for product performance are getting higher and higher, and the performance of DKDP Pockels cells in terms of optical uniformity, extinction ratio, transmittance, etc. is also gradually improving. DKDP Pockels cells have gradually developed from the original single component to products with accessories such as polarizers, wave plates and ceramic sheets, which are convenient for downstream manufacturers to apply.

The global DKDP Pockels Cells market size was estimated at USD 74.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
