Abstracts

A Digital Micromirror Device (DMD) is a micro-opto-electromechanical system (MOEMS) that consists of an array of microscopic mirrors fabricated on a semiconductor chip, where each mirror can be individually tilted to reflect light either toward or away from a projection lens or optical path; these mirrors, typically made of aluminum and mounted on hidden hinges, are controlled by underlying CMOS memory cells that electrostatically actuate each mirror into one of two stable states (on or off) at high speeds, enabling precise modulation of light for applications such as digital projection, 3D printing, lithography, spectroscopy, and structured illumination in industrial and scientific instrumentation.

The global Dmd Digital Micromirror market size was estimated at USD 1035.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
