Abstracts

DNA Fragment Synthesis Service is a biotechnology solution that enables the custom synthesis of DNA fragments based on user-defined sequences, using chemical synthesis and molecular cloning technologies. It is widely used in genetic engineering, synthetic biology, vaccine development, protein expression, and diagnostic assay design. The service offers double- or single-stranded DNA fragments ranging from a few dozen to several thousand base pairs, with options for standard sequences, custom features such as restriction sites or functional tags, and optimization for challenging sequences like high GC content or repeats. Compared to PCR-based methods, DNA synthesis provides superior accuracy, design flexibility, and shorter turnaround times. Synthesized DNA is typically sequence-verified and highly purified, and can be delivered as naked fragments or cloned into vectors. This service provides a powerful and scalable platform for building complex genetic constructs and engineered strains, supporting cutting-edge innovation in life science research and biotechnological applications.

The global DNA Fragment Synthesis Service market size was estimated at USD 2194.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
