Report Overview

DNA gene chips or DNA microarrays are tiny chips that are engrafted with DNA molecules. A DNA gene chip size resembles the size of a postage stamp. A DNA microarray consists of a set of microscopic DNA spots attached on a solid surface. Every DNA spot consists of picomoles of a definite DNA sequence, known as probes. These probes can be a small section of a gene or a DNA element that are used to hybridize a cRNA or cDNA sample (called target) under stringent conditions. These powerful and versatile arrays are frequently used in genetic and medicinal research owing to their ability to speed up the research process.
