Abstracts

DNA methylation analysis service refers to a laboratory or research service that studies the addition of methyl groups to the DNA molecule, particularly to the cytosine base in CpG dinucleotides. This epigenetic modification can regulate gene expression without changing the DNA sequence itself, influencing cellular processes and potentially contributing to diseases like cancer. The service typically involves high-throughput techniques such as bisulfite sequencing, methylation-specific PCR, or microarrays to examine DNA methylation patterns in specific genes or across the entire genome. The analysis provides insights into gene regulation, development, and disease mechanisms, and is often used in research, clinical diagnostics, and drug development. The DNA methylation analysis service industry is undergoing rapid transformation, driven by technological advancements and expanding clinical applications. The industry is shifting from traditional bisulfite sequencing to scalable techniques like reduced representation bisulfite sequencing (RRBS) and methylation arrays, which enable simultaneous analysis of thousands of CpG sites at lower costs. Single-cell methylation analysis is gaining traction to study cellular heterogeneity in diseases like cancer and neurodegenerative disorders. Combined with transcriptomics and proteomics, this multi-omics approach provides a holistic view of gene regulation.

The global DNA Methylation Analysis Service market size was estimated at USD 580.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
