## Abstracts

DNA Methylation Antibodies are specialized research tools used to study DNA methylation, a fundamental epigenetic modification. This process involves the addition of a methyl group to a cytosine nucleotide, typically in a CpG dinucleotide, which generally leads to gene silencing. These antibodies are designed to specifically recognize and bind to these methylated or related cytosine bases. By doing so, they enable scientists to detect the location and quantity of DNA methylation within a cell's genome. They are indispensable for various molecular biology techniques like Chromatin Immunoprecipitation (ChIP) and immunohistochemistry, allowing for a precise mapping of methylation patterns and providing crucial insights into gene regulation, disease development, and cellular differentiation.

The global DNA Methylation Antibodies market size was estimated at USD 203.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
