Abstracts

DNA methylation is an important component of epigenetics and plays an important role in maintaining normal cell function, genetic imprinting, embryonic development, and human tumorigenesis. Whole Genome Bisulfite Sequencing (WGBS), which treats genomic DNA with bisulfite to convert unmethylated cytosine C to uracil U, and performs whole-genome weighting on the treated DNA Sequencing and comparison with the reference genome to achieve single-base resolution and high-accuracy methylation level analysis from the genome level, widely used in basic mechanisms such as cell differentiation, tissue development, animal and plant breeding, human health And research fields such as disease treatment. DNA methylation sequencing is a technique used in genomics and epigenetics research to analyze DNA methylation patterns, which play a crucial role in gene regulation and various biological processes. This market has witnessed significant growth due to its relevance in understanding disease mechanisms, identifying biomarkers, and advancing personalized medicine. Continuous developments in DNA methylation sequencing technologies, such as bisulfite sequencing, whole-genome bisulfite sequencing (WGBS), and targeted methylation sequencing, have improved accuracy and reduced costs. The emergence of single-cell DNA methylation sequencing techniques has enabled the study of methylation patterns at the single-cell level, opening up new research possibilities.

The global DNA Methylation Sequencing market size was estimated at USD 1595.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.90% during the forecast period.
