Abstracts

DNA probe-based diagnostics represent a sophisticated molecular diagnostic technology that utilizes short, single-stranded sequences of labeled DNA or RNA (probes) designed to bind specifically to complementary nucleic acid sequences in clinical samples, enabling the highly sensitive and specific detection of pathogens, genetic mutations, or biomarkers associated with diseases. These assays function through hybridization, where the probe binds to its target sequence, and detection is facilitated via labels such as fluorescent dyes, enzymes, or radioactive tags, allowing for precise identification even at low concentrations. This technology is widely applied across infectious disease testing, oncology, genetic disorders, and pharmacogenetics, offering advantages in accuracy, speed, and the ability to detect non-culturable or slow-growing organisms, though it requires specialized equipment and expertise. The methodology forms the basis for various platforms, including in situ hybridization, microarrays, and real-time PCR applications, playing a critical role in personalized medicine and early diagnosis.

The global Dna Probe Based Diagnostic market size was estimated at USD 9500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
