Abstracts

DNA subcloning services involve the process of isolating a specific DNA fragment from a larger DNA molecule (such as a plasmid, genomic DNA, or cDNA) and inserting it into a new vector. Specialized molecular biology techniques, including restriction enzyme digestion to cut the DNA at specific sites, DNA ligation to join the fragment to the vector, and transformation to introduce the recombinant DNA into host cells (usually bacteria), are used. These services are provided by laboratories or companies to researchers, biotech firms, and pharmaceutical companies, enabling them to manipulate and study genes, produce recombinant proteins, or develop gene - based therapies by precisely engineering DNA constructs tailored to their specific experimental or commercial needs.

The global DNA Subcloning Services market size was estimated at USD 176.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
