Abstracts

DNS-over-TLS (DoT) is a security protocol that encrypts DNS queries and responses using the Transport Layer Security (TLS) protocol, typically operating over TCP port 853. By securing DNS traffic, DoT prevents eavesdropping, tampering, and spoofing by third parties such as ISPs or malicious actors. It enhances user privacy by ensuring that DNS lookups are not visible in plaintext, making it harder for intermediaries to monitor browsing activity. DoT is supported by various DNS resolvers and is increasingly adopted in operating systems and routers to strengthen internet security and privacy.

The global DNS-over-TLS (DoT) market size was estimated at USD 326.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.30% during the forecast period.
