## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Doctor Blade Coater competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A doctor blade coater is a precision coating device widely used in printing, battery electrode manufacturing, film production, and materials research to apply a thin, uniform layer of liquid or slurry onto a substrate. It works by using a blade (the 'doctor blade') positioned at a controlled gap above the substrate; as the coating material is spread, the blade regulates the thickness of the wet film. By adjusting parameters such as blade angle, gap height, coating speed, and slurry viscosity, the coater can achieve highly consistent film thickness ranging from micrometers to millimeters. Doctor blade coaters are essential in applications requiring uniform functional layers, such as lithium-ion battery electrodes, solar cells, OLED displays, membranes, adhesives, and biomedical films. Their key advantages include simple design, flexible thickness control, scalability for lab or pilot production, and compatibility with a wide range of coating materials. Advanced systems may integrate automatic gap control, heating stages, and programmable movement for higher precision and reproducibility. Because of their cost-effectiveness and versatility, doctor blade coaters are a standard tool in both R&D labs and industrial-scale thin film production lines. In 2024, global doctor blade coater production reached approximately 104.61 k units, with an average global market price of around US\$ 8741 per unit. And global doctor blade coater production capacity reached approximately 150 k units. The average gross margin in this industry reached 19.35%. Upstream: The doctor blade coater industry relies on precision-engineered materials and components. Key inputs include high-quality steel or ceramic for doctor blades, coating formulations (such as adhesives, conductive inks, and functional slurries), and precision mechanical parts for coating heads and rollers. These materials

directly determine coating uniformity, thickness accuracy, and equipment durability. Representative upstream suppliers include Sandvik (specialty steels for blades), BASF (coating chemicals and additives), and CeramTec (advanced ceramics). Continuous advances in materials science and chemical formulations are enabling more efficient, wear-resistant, and application-specific doctor blade systems. Downstream: Doctor blade coaters are widely used in industries requiring precise surface coatings, such as paper and packaging, lithium-ion batteries, displays, and printed electronics. They are critical for ensuring uniform layers in electrode manufacturing, functional films, and specialty papers. End users demand high precision, scalability, and compatibility with diverse coating materials. Representative downstream players include Nippon Paper Industries (paper and packaging), CATL (battery electrode manufacturing), and LG Display (electronic displays). With rapid growth in electric vehicles, flexible electronics, and sustainable packaging, downstream markets are pushing doctor blade coaters toward higher automation, digital control, and compatibility with next-generation functional coatings.

The global Doctor Blade Coater market size was estimated at USD 914.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
