Abstracts

Dog DNA testing is a scientific method that collects saliva samples from dogs and analyzes their genetic material to obtain key information. Its core services include two aspects: breed composition analysis (accurately analyzing the origin of mixed-breed dogs, tracing the ancestral breeds and proportions) and health risk screening (detecting hundreds of genetic disease risks, drug sensitivity and potential health risks associated with specific breeds). This technology helps owners gain a deeper understanding of their dogs' physical characteristics and behavioral tendencies, and provides a genetic basis for personalized care, disease prevention and scientific breeding. The global dog DNA test production is concentrated in North America and Australia. Embark Veterinary is the world's largest dog DNA test manufacturer, with a share of more than 40%. North America is the largest and most mature market, dominating the global market with a share of about 60%. This is due to the high degree of pet humanization, high disposable income, mature market education, and the promotion of major brands such as Embark and Wisdom Panel. The Asia-Pacific region is seen as the market with the greatest growth potential, with the highest CAGR expected, especially in countries such as China, Japan, and Australia. The rapid expansion of the pet economy, the growth of the middle class, and the increase in attention to pet health are the main driving forces, but the current penetration rate is still far lower than that of North America. Dog DNA testing companies have formed a competition form between the first, second, and third levels. As technology matures and competition intensifies, the price of the test has become more affordable, and the price of the entry-level kit has been significantly reduced. At the same time, the online purchase and sample delivery process is very convenient. With the continuous advancement of technology, the coverage and accuracy of the detection chip are constantly improving, and the database continues to expand, which can provide richer information (such as traits, health risks, ancestry analysis, close relative search, etc.). Despite the price reduction, comprehensive health

+ breed testing kits (especially high-end products) are still a considerable expense for some consumers. Different companies have different databases, algorithms and coverage sites, which may lead to different results. The predicted probability of health risks rather than definitive diagnosis sometimes causes confusion or concern. The detection ability of some rare diseases or new mutations is limited. Looking forward, dog DNA testing will shift from "breed identification" to "health risk management". The detection range will cover a wider range of genetic diseases. Veterinarians will become an important referral channel, and genetic data will be included in pet health records to guide personalized diet, vaccines, physical examinations and medication plans. Users have a surge in demand for early intervention using genetic information (especially in disease-prone breeds).

The global Dog DNA Test market size was estimated at USD 237.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.30% during the forecast period.
