Abstracts

A Doppler Sonar Log is a specialized tool used in marine and underwater surveying to measure the velocity of the seafloor or subsurface layers relative to the survey vessel. It operates based on the Doppler effect, emitting sound waves and analyzing the frequency shift of the reflected waves to calculate the movement or speed of objects beneath the water's surface. This technology is commonly used for applications such as seabed mapping, sediment transport analysis, underwater navigation, and monitoring the movement of materials in dredging or drilling operations. Doppler sonar logs provide precise, real-time data on underwater velocities and are valuable for both scientific research and industrial operations.
