### Report Overview

Double-beam electron microscope is a transmission electron microscope (TEM), which uses two electron beams to image the sample. In traditional TEM, a single electron beam is used to pass through a thin sample and generate images by interacting with atoms in the material. However, in a double-beam electron microscope, a second electron beam is used to irradiate the sample at different angles at the same time. The double-beam electron microscope allows observation of the dynamics of the sample and provides additional information about the structure and properties of the sample. For example, by irradiating the sample with a second beam of light, researchers can observe the response of the sample to external stimuli (such as electric field or temperature change). This technology is particularly suitable for studying materials with complex structure or dynamic behavior, such as biomolecules, semiconductors and nanomaterials.

The global Double Beam Electron Microscope market size was estimated at USD 285.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
