Report Overview:

A valve is a device that regulates, directs or controls the flow of a fluid by opening, closing, or partially obstructing various passageways. The term Double Block and Bleed initially meant two separate block valves with a pipe and bleed valve between the valves to check for leakage. According to API 6D “Specification for Pipeline Valves” standards, a double block-and-bleed valve is a “single valve with two seating surfaces that, in the closed position, provides a seal against pressure from both ends of the valve, with a means of venting/bleeding the cavity between the seating surfaces.” Double block and bleed valves are used to achieve positive isolation when performing maintenance activities in a live process plant. Typically two block valves and a bleed valve are manufactured as a single assembly and this double block and bleed valve manifold can be readily installed for isolation purpose. Double block and bleed valves are usually used for critical process service, such as high pressure system or toxic, hydrocarbon or hazardous process fluids. For non-critical service, single block and bleed valve assemblies must be used. Double block and bleed valves are also often used with spectacle blind or blind spacers to provide positive isolation. Double block and bleed valve assemblies allow fewer potential leakage paths compared to traditional multiple valve installations, thus increasing safety of the design.

The Global Double Block and Bleed (DBB) Valves Market Size was estimated at USD 454.01 million in 2023 and is projected to reach USD 554.86 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
