Abstracts

The double chamber vacuum oil quenching furnace is a specialized piece of equipment for high-performance metal heat treatment, integrating vacuum heating with oil quenching. It features separate heating and oil quenching chambers, allowing uniform heating in a vacuum environment to prevent oxidation and decarburization. During the cooling phase, workpieces are transferred to the oil quenching chamber, where rapid and uniform cooling via the oil medium ensures excellent mechanical properties and microstructure. This furnace is ideal for materials such as alloy steels, tool steels, and stainless steels, commonly used in the production of precision components, molds, gears, and aerospace parts. The dual-chamber design enhances operational efficiency, minimizes cross-contamination, and ensures reliable quality control.

The global Double Chamber Vacuum Oil Quenching Furnace market size was estimated at USD 246.46 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
