Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Double-Conversion UPS competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of double-conversion UPS was 613,000 units, with an average price of US\$4,366 per unit. Double conversion UPS modules provide uninterrupted power to critical loads. They do this by filtering and converting incoming utility power to DC power, then converting the DC power to a perfect AC output from the inverter. The inverter is also supported by a DC source that may include batteries. The upstream of the double-conversion UPS industry chain mainly includes suppliers of power semiconductors, capacitors, inductors, IGBT modules, and battery cells. Representative companies include Infineon, Texas Instruments, Panasonic, BYD, and CATL. Downstream customers are concentrated in IDC operators, communication equipment manufacturers, hospital electromechanical system integrators, industrial control companies, and government agencies, such as Huawei Cloud, Tencent Data Center, Siemens, GE Healthcare, and NTT. These customers have extremely high requirements for power continuity, harmonic suppression, and energy efficiency conversion, driving the continued growth of high-end double-conversion UPS. Current industry trends are characterized by the rapid advancement of high power density, modularity, and intelligent management. The accelerated construction of data centers and Industry 4.0 is transforming UPS from a single backup power source into an intelligent energy management node. Driving factors include the expansion of global digital infrastructure, the increase in the construction of AI computing centers, the increased power quality requirements for renewable energy grid connection, and the strengthening of policy standards for power security in the medical and financial sectors. The main obstacles lie in the fluctuating costs of core IGBTs and energy storage

batteries, the difficulty in optimizing heat dissipation and efficiency, and the long certification cycles and high technology adaptation costs caused by differences in national power standards. A medium-sized double-conversion UPS production line can produce approximately 20,000 to 30,000 high-power units annually. The gross profit margin for low-to-medium power models is approximately 20% to 28%, while that for high-power data center-grade UPS can reach 35% to 45%.

The global Double-Conversion UPS market size was estimated at USD 2678.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
