The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Double Deck Vibrating Screen competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Double Deck Vibrating Screen will reach 5,877 units, with an average selling price of US\$49,000 per unit. A double-deck vibrating screen is a highly efficient grading and screening device widely used for particle size separation of solid particulate materials. It consists of two layers of screens: the upper layer intercepts coarse particles, while the lower layer screens medium or fine particles, achieving multi-stage screening. Vibrating motors or eccentric shaft exciters generate vibration, causing the material to diffuse in a spiral motion across the screen surface, rapidly separating particles of varying sizes. The double-deck design can simultaneously process two or three particle sizes, achieving a screening efficiency exceeding 95%. It is suitable for continuous operation and offers advantages such as low energy consumption, low noise, and easy maintenance. Screen materials include stainless steel, polyurethane, and woven mesh to meet diverse operating requirements.

The global Double Deck Vibrating Screen market size was estimated at USD 288.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
