Abstracts

Double disc gate valves are a type of industrial valve designed primarily for isolation applications in pipelines, characterized by their two parallel, wedge-shaped discs that move perpendicular to the flow direction to either fully open or fully close the passage. These valves are engineered to provide a tight seal with minimal friction during operation, making them suitable for handling high-pressure and high-temperature fluids, including water, steam, oil, and gas, across sectors such as oil and gas, power generation, water treatment, and chemical processing. The double disc design enhances sealing reliability and reduces wear on seating surfaces, often incorporating features like rising or non-rising stems, and they are typically constructed from materials like cast iron, carbon steel, stainless steel, or alloys to withstand corrosive and abrasive media. Their robust construction and ability to maintain leak-tight closure under demanding conditions position them as critical components in systems where flow control, safety, and durability are paramount.

The global Double Disc Gate Valves market size was estimated at USD 1450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
