Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Double Hinge Expansion Joint competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The double hinge expansion joint is composed of two corrugated pipes connected to the intermediate pipe, pins, hinge plates, and vertical plates and other structural parts. It can only absorb lateral displacement in one plane and can withstand the pressure and thrust of the bellows. Planar double hinge expansion joints (referred to as double hinge expansion joints) are often used in L-shaped and planar Z-shaped pipelines to absorb lateral displacement. The pull plate is more rigid than the complex universal long pull rod. It can absorb more lateral displacement by using longer pull plates. The disadvantage is that it can only absorb the displacement of the plane. The universal double hinge type expansion joint (referred to as the double universal hinge type expansion joint) can absorb displacement in any direction because of the pin blocks used in the hinge. Commonly used in facade Z-shaped pipes. In 2024, global Double Hinge Expansion Joint production reached approximately 764 k units, with an average global market price of around US\$ 1284 per unit.

The global Double Hinge Expansion Joint market size was estimated at USD 981.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
