## Abstracts

Double jacketed gaskets are specialized sealing components designed for high-pressure and high-temperature applications, primarily used in critical industrial settings such as chemical processing, oil and gas, power generation, and pharmaceutical manufacturing. These gaskets consist of an inner metallic core—often made from materials like stainless steel, carbon steel, or exotic alloys—encased within two layers (jackets) of softer, conformable material such as graphite, PTFE, or compressed non-asbestos fibers. This dual-layer construction enhances sealing performance by allowing the softer outer layers to conform to flange surfaces, ensuring a tight seal even under fluctuating pressures, temperatures, or corrosive conditions, while the inner core provides structural integrity and resistance to blowout. Their design is particularly suited for preventing leaks in systems handling aggressive media, making them a preferred choice over standard gaskets in scenarios demanding reliability, safety, and compliance with stringent industry standards.

The global Double Jacketed Gasket market size was estimated at USD 110.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
