Abstracts

A double lumen catheter is a specialized medical device designed for simultaneous access to a single blood vessel or body cavity through two separate channels, or lumens, within one catheter body. Typically constructed from biocompatible materials such as silicone or polyurethane, these catheters feature distinct inlet and outlet ports that allow for concurrent infusion and withdrawal of fluids, making them particularly useful in hemodialysis, apheresis, chemotherapy, and critical care settings where efficient and continuous vascular access is required. The dual-lumen design minimizes the need for multiple insertions, reduces patient discomfort, and enhances procedural efficiency by enabling tasks such as blood withdrawal and return during dialysis or simultaneous administration of incompatible medications without cross-contamination.

The global Double Lumen Catheter market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
