Abstracts

A double lumen extension tube is a specialized medical device used primarily in critical care, anesthesia, and infusion therapy settings to facilitate the simultaneous or sequential administration of multiple medications, fluids, or contrast agents through a single vascular access point, such as a central venous catheter or peripherally inserted central catheter (PICC). It consists of two separate, color-coded channels (lumens) within a single tubing structure, each equipped with its own connector (e.g., luer lock) and often featuring clamps, injection ports, or stopcocks to control flow and prevent cross-contamination between infusions. Designed to enhance procedural efficiency and reduce the risk of infection or line contamination by minimizing connection/disconnection events, these tubes are engineered for compatibility with standard infusion systems and are typically made from medical-grade materials like polyvinyl chloride (PVC) or thermoplastic elastomers (TPE) to ensure flexibility, kink-resistance, and biocompatibility. Their application is common in scenarios requiring complex drug regimens, hemodynamic monitoring, parenteral nutrition, or chemotherapy, where maintaining separate infusion pathways is critical to drug stability and patient safety.

The global Double Lumen Extension Tube market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
