Abstracts

The double screw feeder is a device used to transport materials from one location to another. It is widely used in various industrial fields, especially in the chemical, mining, metallurgy, building materials and food processing industries. The device consists of two relatively rotating spiral blades, which push or lift the material through the rotating spiral device to achieve uniform material transportation. The double screw design enables the material to maintain stable fluidity during the transportation process and effectively avoids the accumulation or blockage of the material. Compared with the single screw feeder, the double screw feeder has a higher conveying capacity and better material uniform distribution performance, and is suitable for material conveying tasks with larger flow or higher precision requirements. The double screw feeder is usually equipped with a precise control system to adjust the speed, conveying volume and pressure of the screw according to the characteristics and conveying requirements of different materials, so as to ensure the efficiency and stability of the entire conveying process. Due to its simple structure, easy operation and low maintenance cost, the double screw feeder has become an ideal choice for material transportation in many industries. In addition, it can also customize spiral blades of different sizes and materials according to needs to meet the conveying requirements of various materials (such as particles, powders, slurries, granular materials, etc.).

The global Double Screw Feeder market size was estimated at USD 355.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
