Abstracts

Double shell desulfurization pump is a pump equipment specially designed for handling solid particles and corrosive media. It adopts a double pump shell structure. The front pump shell and the rear pump shell are connected together by bolts to form a relatively sealed cavity. This design not only improves the strength and stability of the pump, but also facilitates the maintenance and replacement of the pump body. The impeller, volute, front guard plate, rear guard plate and other flow-through parts of the double shell desulfurization pump can be replaced, and the pump outlet can be rotated and installed at multiple angles. It has the characteristics of high efficiency, stability, corrosion resistance, wear resistance and easy maintenance. It is widely used in flue gas desulfurization systems in industrial fields such as coal-fired power plants, steel plants, and refineries.

The global Double Shell Desulfurization Pump market size was estimated at USD 753.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
