Abstracts

Double-sided polished copper foil is characterized by a symmetrical structure of two smooth sides, metal density close to the theoretical density of copper, and excellent elongation and tensile strength. It can be used as anode carrier and collector for lithium-ion batteries. Compared with single-sided gross and double-sided gross lithium copper foil, its contact area increases exponentially when it is bonded with the negative electrode material, which can significantly reduce the contact resistance between the negative electrode collector and the negative electrode material and improve the symmetry of the negative electrode sheet structure of lithium-ion batteries. Meanwhile, the double-sided light lithium copper foil has good resistance to cold and heat expansion, and the negative electrode sheet is not easy to break during the charging and discharging process of the battery, which can prolong the service life of the battery.

The global Double-sided Polished Electrolytic Copper Foil market size was estimated at USD 159.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 21.60% during the forecast period.
