Abstracts

The double-station glove box is a laboratory equipment with two independent operating spaces, each of which is equipped with a set of gloves so that the operator can perform experiments or operations without direct contact with the external environment. The interior of the double-station glove box is divided into two independent operating spaces, each of which can be controlled separately without affecting each other. The double-station glove box has good sealing performance, which can effectively prevent the outside air, moisture and microorganisms from entering the operating space, ensuring the accuracy and reliability of the experiment or operation. Because it has two independent operating spaces, the double-station glove box can carry out different experiments or operations at the same time, improving work efficiency. For example, materials can be processed at one station and tested or analyzed at another station.

The global Double-station Glove Box market size was estimated at USD 136.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
