Report Overview

Double vacuum steel ingot is a high-purity steel ingot prepared using double vacuum smelting process. This process refers to two smelting operations under vacuum conditions. The first time is to remove impurities and gases in the steel through the oxide reduction method, and the second time is to further improve the purity and uniformity of the steel through the electroslag remelting method. Double vacuum steel ingots have the advantages of high purity, low gas content, low inclusion content, and good uniformity, and are important raw materials for preparing high-quality steel. Double vacuum steel ingots are widely used in aviation, aerospace, nuclear industry, electronics and other high-end fields, such as manufacturing aerospace engines, nuclear reactor pressure vessels, semiconductor materials, etc.
