Report Overview

Doubly-fed wind power converter is an important part of the doubly-fed wind power grid-connected generation system, which is adapted to the doubly-fed wind turbine. The converter consists of a machine side converter and a grid side converter, which are connected via an intermediate DC bus. The machine side converter is connected to the rotor of the generator. When the rotor speed changes with the wind speed, the frequency, amplitude and phase of the rotor current are controlled to ensure the constant voltage and frequency control on the stator side, so as to realize the variable speed and constant frequency control of the wind turbine, and the active and reactive power regulation of the generator under various working conditions.
