### Report Overview

A downpipe sampler is a device used in environmental monitoring to collect samples of air pollutants emitted from industrial stacks or exhaust pipes. It is typically installed at the exit point of the stack or pipe and is designed to capture a representative sample of the emissions.

The downpipe sampler consists of a sampling probe that extends into the stack or pipe, a sample collection system, and a control unit. The probe is usually made of stainless steel and is designed to withstand high temperatures and corrosive gases. The sample collection system may include filters, impingers, or other devices to capture and retain the pollutants.

The control unit of the downpipe sampler regulates the flow rate of the sample and ensures that it is representative of the emissions. It may also include sensors and instruments to measure various parameters such as temperature, pressure, and flow rate.

Once the sample is collected, it can be analyzed in a laboratory to determine the concentration and composition of pollutants present in the emissions. This information is crucial for assessing the environmental impact of industrial activities and for regulatory compliance.
